

## Teucrium scorodonia

*Teucrium scorodonia*, common name the woodland germander<sup>[1]</sup> or wood sage, is a species of flowering plant in the genus *Teucrium* of the family Lamiaceae. It is native to Western Europe and Tunisia, but cultivated in many places as an ornamental plant in gardens, and naturalized in several regions (New Zealand, Azores, and a few locales in North America).<sup>[2]</sup><sup>[3]</sup>

*Teucrium scorodonia* reaches on average 30–60 centimetres (12–24 in) of height. It is a hairy herbaceous perennial with erect and branched stems. The leaves are petiolate, irregularly toothed, triangular-ovate to oblong shaped, lightly wrinkled. The inflorescence is composed by one-sided (all flowers "look" at the same side) pale green or yellowish flowers bearing four stamens with reddish or violet filaments. These flowers grow in the axils of the upper leaves and are hermaphrodite, tomentose and bilabiate but lack an upper lip, as all *Teucrium* ones. The flowering period extends from June through August. These plants are mainly pollinated by Hymenoptera species.

These plants prefer sandy soils in woodland and acid heaths, at an altitude of 0–1,500 metres (0–4,921 ft) above sea level.
